the results was, that when a party of them had made an agreement to serve him they did not keep it, but ran away. He had engaged 186 of them, but only eighteen had adhered to him throughout the whole of the journey. He then described the great efforts he had been compelled to make in order that his caravans might be fed. He had only two guns, and with them he shot rhinoceroses, buffaloes, birds, &c. Afterwards his men became blind and stricken with fever, and it was months before they could proceed on their journey, and then only in detachments. In proceeding through one of the kingdoms he found the Sultan most anxious to detain him, in order that he might fleece him. The King of Uganda was their greatest friend. He and his people were not pure negroes. It appeared to him that there had been an immigration of the Abyssinian race, and the result was that the people had not the nose of the negro, but noses like Europeans. They were tall gaunt men, but they had the curly hair of the negro. They had lost their language, and they had also lost religion, for they had no idea of a soul. The King of Karagwe possessed a very inquiring mind. He asked about the stars and moon, and also what became of the old suns. He (Captain Speke) first taught the King to shoot. When he first handled a gun he placed it on his thigh and shot the cows in the courtyard. The King had given him a great deal of geographical information, and he was very much opposed to his leaving. Captain Speke then related several interesting anecdotes, and concluded amid the loud cheers of the Meeting.

The President then presented to Captain Speke the Gold Medal which the King of Italy had sent to him, and intimated that a similar medal was on its way for Captain Grant. He therefore, in the name of the Society, offered their grateful thanks to the King of Italy for His Majesty's good will, and amid great applause called upon the distinguished Italian geographer, Signor Negri Cristoforo, who was present, to explain to the Meeting how deeply his Sovereign and his countrymen appreciated the arduous enterprise so successfully executed by Captains Speke and Grant.

Signor Negri Cristoforo returned thanks in an eloquent speech in his native language, which was much applauded.

The President having expressed a hope that some honours of the British Crown would be conferred on the discoverers of the Nile, concluded by moving that a cordial vote of thanks should be given to Captains Speke and Grant, which was carried amid the greatest enthusiasm, and the Meeting terminated.

* The medal for Captain Grant has since arrived, and bears the following inscription: 'Al Capitano Grant: divino col Capitano Speke gloria e perpetu.
the march between Uganda and Unyoro are the highest of the whole year. They are not, however, considered by Captain Grant to have been observed under circumstances favourable to accuracy. The maximum once reached 91°, and twice reached 89°. The Unyoro maximum was 88°; its minimum ranged between 61° and 72°.

Rain.—The annual rainfall is 49 inches,—an unusually small amount for an equatorial region, and inferior to that of many places in the British Isles. This deficiency is reasonably to be accounted for upon physico-geographical data. The outflow of water from every district must be ultimately supplied by clouds charged with vapour originally generated by evaporation of the water of the ocean. Now, the district of Lake Nyanza is peculiarly ill-situated for receiving rain-bearing winds from the African coast. The vast desert of the Sahara cuts off all moisture from the north; and the easterly winds which were chiefly met with by Speke and Grant, must have deposited the larger portion of their load of water when they first impinged on the rampart-like eastern edge of the East African plateau.

The wind is variable during the rainiest season, at other times easterly winds prevail.

The sky was remarkable as being either very clear, with fleeting clouds, or heavily overcast, with low black clouds.

The wet and dry seasons are imperfectly marked in the Nyanza districts. Their most distinct manifestation was in the April and November rains, and in the comparatively dry weather that immediately preceded the former. It must be remarked that Speke's 21 days of "rainy or light showers" during March, in Uganda, corresponds only to 11 days during which enough rain fell at Karagwe to enable Grant to measure it. The frequency of these showers is, therefore, an imperfect criterion of the wetness of the month.

Taking the average of the whole year, there is rain of some description, whether heavy or slight, on two days out of every three. A sufficient rainfall takes place to be worthy of measurement by the gauge, on one day out of every two. About once a month a heavy burst of rain occurred, to the amount of one or two inches; and fully one-third of the annual rainfall was contributed by these occasional storms. The river-beds were often suddenly filled in consequence of partial deluges; and masses of tangled grass, with soil attached to them, were washed down to the Nile during the rainiest months; but there is no appearance of the level of the Lake Nyanza being affected by the different seasons in any considerable degree. Thus, in the sketch of the outflow of the Nile, trees of some years' growth are seen to clothe the promontories down to the water's edge. On the other hand, it is well known that the rainy and dry periods are sharply defined at Gondokoro, and even so far to the north of that place as Miani had explored, viz. to north latitude 3° 34'. We must, therefore, ascribe the rise and fall of the trunk stream of the Lower Nile to the periodicity of the rains that feed it south of the 3rd degree of north latitude, and, in a very considerable degree, to the periodicity of the rains that fall upon the land whose drainage is into the Lake Nyanza.
